

R395 OCTOPUS

OVERVIEW

PARAMETERS

CHOOSE A SCUBAPRO OCTOPUS

Why are R395 and R295 a great offer for your octopus?

- Classic downstream valve for safe and reliable performance due to robust design and low maintenance.
- 39-inch hose for convenient alternate air source function with yellow hose protector and yellow regulator cover for easy identification
- Left & right hose attachments for extra flexibility and comfortable positioning, so you can keep it on whatever side feels best. Right hand attachment is supplied as standard but the left hand conversion can be performed by an Authorised **SCUBAPRO** service technician.
- Compact size and lightweight materials for comfort and reduced drag during the dive.
- Orthodontic silicone mouthpiece in smaller size for perfect fit, no gum irritation and less jaw fatigue.
- R395 Octopus matches all **SCUBAPRO** first stages.
- R395 features diver's adjustable VIVA for personal breathing comfort and our R295 has fixed VIVA for safe and uncomplicated use.

R395 OCTOPUS - The Ideal Octopus

- **Classic downstream valve** - Classic downstream valves are particularly noted for their legendary safety and reliability. When in use, the downstream valve opens in the same direction as the incoming air flow. To close the valve and stop the air flow, a spring counteracts the force of the incoming air. Therefore, a certain inhalation effort is always required to overcome the spring tension and open the valve.
- **Diver Adjustable VIVA** (Venturi Initiated Vacuum Assist) flow vane for personalized breathing comfort. Another **SCUBAPRO** patented feature, the VIVA is available on all **SCUBAPRO** second stages. VIVA uses the power of a vacuum assist to reduce work of breathing and increase breathing comfort. It is diver adjustable on all current **SCUBAPRO** second stages except the R295, since it is a second stage intentionally designed for diver training courses, rental facilities and divers demanding ready to use equipment. A VIVA in MAX position gives powerful breathing support on every single breath; a VIVA in MIN position helps to prevent free flow on the surface, for training, for buddy breathing, in currents or when used as an octopus.
- Extremely **lightweight** and **compact**. Comfortable for all divers, including novice divers newly initiated in the sport.
- **Orthodontic mouthpiece**. **SCUBAPRO** uses a comfortable orthodontic mouthpiece on every second stage to reduce jaw fatigue and gum irritation. It was developed by dentists and dental laboratories and lasts longer than any other mouthpiece, because only a minimum effort is needed to hold it comfortably in place.
- **39-inch hose** for convenient alternate air source function with yellow hose and yellow regulator cover for easy identification
- **Left & right hose attachments** for extra flexibility and comfortable positioning, so you can keep it on whatever side feels best. Provided in standard right hand

attachment. Left hand conversion can be performed by any Authorized **SCUBAPRO** service technician.

- **Compact size** and lightweight materials for comfort and reduced drag during the dive.
